Publication No. US2004003107ZA1

GENERAL INFORMATION:

APPLICANT: La Rosa Thomas J

APPLICANT: Kovalic David K

APPLICANT: Cao Yongwei

TITLE OF INVENTION: Soy Nucleic Acid Molecules and Other Molecules Associated With

TITLE OF INVENTION: Plants and Uses Thereof for Plant Improvement

CURRENT APPLICATION NUMBER: US/10/424,599

CURRENT FILING DATE: 2003-44-28

NUMBER OF SEQ ID NOS: 285684

SEQ ID NO 87144

LENGTH: 647

TYPE: DNA

ORGANISM: Glycine max

FEATURE TERMED TIMESTANCE: --

Comments: SF2p33 is an essential pre-mRNA splicing factor, which can also affect alternative 5' splice site selection in vitro by stimulating the use of proximal 5' splice sites.

(Krainer, A.R., Conway, G.C., and Kozak, D. (1990) Purification and Characterization of SF2, a Human Pre-mRNA Splicing Factor: Genes Dev. 4, 1158-1171; Krainer, A.R., Conway, G.C., and Kozak, D. (1990) The Essential Pre-mRNA Splicing Factor SF2 Influences 5' Splice Site Selection by Activating Proximal Sites. Cell 62, 35-42). This factor is also known as ASF (Ge, H., and Manley, J.L. (1990) A protein Factor, ASF, Controls Alternative Splicing of SV40 Barly Pre-mRNA In Vitro. Cell 62, 25-34). SF2 p33 consists of two polypeptides of apparent molecular weight 33 kd, approximately, although their predicted molecular weight 527,744 daltons. The two forms appear to differ by the extent of post-translational modification, which includes phosphorylation. SF2p33 binds RNA and promotes the annealing of complementary RNAs. It is required for assembly of pre-spliceosome complexes. The Location/Qualifiers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /notes=RRM 1; Region: RNA recognition motif. (a.k.a. RRM, RBD, or RNP domain). The RRM motif is probably diagnostic of an RNA binding protein. RRMs are found in a variety of RNA binding proteins, including various hnRNP proteins, proteins implicated in regulation of alternative splicing, and protein components of anRNPs The motif also appears in a few single stranded DNA binding proteins. The RRM structure consists of four strands and two helices arranged in an alpha/beta sandwich, with a third helix present during RNA binding in some cases The C-terminal beta strand (4th strand) and final helix are hard to align and have been omitted in the SEED alignment The LA proteins have a N terminus rrm which is included in the seed. There is a second region towards the C terminus that has some features of a rrm but does not appear to have the important structural core of a rrm. The LA proteins are of the main autoantigens in Systemic lupus erythematosus (SLE), an autoimmune disease"

Generation and initial analysis of more than 15,000 full-length
human and mouse cDNA sequences
L. Proc. Natl. Acad. Sci. U.S.A. 99 (26), 16899-16903 (2002)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Clone distribution: MGC clone distribution information can be through the I.M.A.G.E. Consortium/LINI at: http://image.llnl. Series: IRAK Plate: 121 Row: p Column: 12
This clone was selected for full length sequencing because it passed the following selection criteria: Hexamer frequency Operator of the following selection criteria: Hexamer frequency operators: Similarity but not identity to protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Web site: http://www.misc.nih.gov/

Bacterial expression system for producing recombinant human uteroglobin for treating inflammatory and fibrotic conditions, comprises a synthetic gene which codes for human uteroglobin.

WPI; 2003-221527/21.

Claim 1; Page 33; 127pp; English.

The present sequence is that of oligonucleotide 2, which was used in the construction of a synthetic gene for the production of human uteroglobin (hUG) in bacteria. Oligonucleotides 1-4 (see ABZ58370-73) were used to assemble the coding strand and oligonucleotides 5-8 (see ABZ58374-77) the complementary strand. The gene was assembled by annealing and ligation of the oligonucleotides. Because mature native hUG has glutamic acid at its N-terminus, an initiator methionine was added to the N-terminus, and

In an example from the invention, the synthetic gene was cloned into plasmid pCG12 (see ABZ58378) and recombinant hUG (see ABZ7259) was produced in Escherichia coli strain CG12. The invention relates generally to the production of recombinant hUG by bacterial expression, protein purification and scaled-up production according to current good manufacturing practices. The recombinant hUG is useful for the treatment of inflammatory and fibrotic conditions, such as neonatal respiratory distress syndrome and bronchopulmonary dysplasia. It may also be used to treat conditions associated with elevated phospholipase A2 levels such as pancreatitis, associated with elevated phospholipase A2 levels such as pancreatitis,
of recombinant human uteroglobin (rhUG), comprising a synthetic gene or human cDNA sequence which codes for human UG, constructed from the oligonucleotides appearing as ADL27626-ADL27629, and which further comprises Met-Ala-Ala at the N-terminus of the sequence. Also included are producing an rhUG master cell bank (comprising inoculating a suitable incubating broth with an aliquot portion of a rhUG research seed bank to form a bacterial culture, incubating the bacterial culture, adding a cryopreservative to the bacterial culture to form a cryopreserved solution, transferring a portion of the cryopreserved solution to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; ss; recombinant human uteroglobin; rhUG; bacterial expression system; rhUG master cell bank; bacterial expression system; rhUG master cell bank; rhUG research seed bank; anti-inflammatory; secretory phospholipase A fibronectin; respiratory distress; inflammation; fibrotic disease.

Bacterial expression system for producing recombinant human uteroglobin for treating inflammatory and fibrotic conditions, comprises a synthetic gene which codes for human uteroglobin.

Example 1; Page 33; 127pp; English

The present sequence is that of oligonucleotide 7, which was used in the construction of a synthetic gene for the production of human uteroglobin (hUg) in bacteria. Oligonucleotides 1-4 (see ABZ58370-73) were used to assemble the coding strand and oligonucleotides 5-8 (see ABZ58374-77) the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
Best Local :
The present sequence is that of oligonucleotide 9, which was used in the construction of a synthetic gene for the production of human uteroglobin (hUG) in bacteria. Oligonucleotides 1-4 (see ABZ58370-73) were used to assemble the coding strand and oligonucleotides 5-8 (see ABZ58374-77) the complementary strand. The gene was assembled by annealing and ligation of the oligonucleotides. Because mature native hUG has glutamic acid at its v-terminus, an initiator methionine was added to the N-terminus, and codon usage was optimised for expression in bacteria. In an example from the invention, the synthetic gene was cloned into plasmid pCG12 (see ABZ58378) and recombinant hUG (see ABP72259) was produced in Escherichia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     complementary strand. The gene was assembled by annealing and ligation of the oligonucleotides. Because mature native MUG has glutamic acid at its N-terminus, an initiator methionine was added to the N-terminus, and codon usage was optimised for expression in bacteria. In an example from the invention, the synthetic gene was cloned into plasmid pCG12 (see ABZ58378) and recombinant hUG (see ABZ58378) was produced in Escherichia coli strain CG12. The invention relates generally to the production of recombinant hUG by bacterial expression, protein purification and scaled-recombinant hUG is useful for the treatment of inflammatory and fibrotic conditions, such as neonatal respiratory distress syndrome and bronchopulmonary dysplasia. It may also be used to treat conditions associated with elevated phospholipase A2 levels such as pancreatitis, accute renal failure, rheumatoid arthritis and asthma
                                                                                                                                                                                                                                                                                                                                           Bacterial expression system for producing recombinant human uteroglobin for treating inflammatory and fibrotic conditions, comprises a synthetic

                                                                                                                                                                                                           Bacterial expression system for production of recombinant human uteroglobin comprising synthetic gene or human cDNA sequence which codes for human uteroglobin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    coli strain CG12. The invention relates generally to the production of recombinant hUG by bacterial expression, protein purification and scaled-up production according to current good manufacturing practices. The recombinant hUG is useful for the treatment of inflammatory and fibrotic conditions, such as neonatal respiratory distress syndrome and bronchopulmonary dysplasia. It may also be used to treat conditions associated with elevated phospholipase A2 levels such as pancreatitis, accute renal failure, rheumatoid arthritis and asthma
                                                                                                                                                                                                                                                                                          Pilon AL,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Synthetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0,
```

The invention relates to a bacterial expression system for the production of recombinant human uteroglobin (rhUg), comprising a synthetic gene or human cDNA sequence which codes for human UG, constructed from the oligonucleotides appearing as ADL27626-ADL27629, and which further comprises Met-Ala-Ala at the N-terminus of the sequence. Also included are producing an rhUG master cell bank (comprising inoculating a suitable incubating broth with an aliquot portion of a rhUG research seed bank to form a bacterial culture, incubating the bacterial culture to form a cryopreserved solution, transferring a portion of the cryopreserved solution to a cryovial and storing the cryovial at a temperature below -60 degrees C), expressing rhUG (comprising providing a production seed cell bank culture accomprising an expression vector capable of expressing rhUG, inoculating a

of recombinant human uteroglobin (rhVG), comprising a synthetic general numan cDNA sequence which codes for human UG, constructed from the coligonucleotides appearing as ADL27626-ADL27629, and which further

The invention relates to a bacterial expression system for the production

gene or

Bacterial expression system for producing recombinant human uteroglobin for treating inflammatory and fibrotic conditions, comprises a synthetic gene which codes for human uteroglobin.

Example 1; SEQ ID NO 7; 64pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            666666666666666666666666666666688
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC comprises Met-Ala-Ala at the N-terminus of the sequence. Also included are producing an rhUG master cell bank (comprising inoculating a suitable includating broth with an aliquot portion of a rhUG research seed bank to CC form a bacterial culture, incubating the bacterial culture, adding a CC cryopreservative to the bacterial culture to form a cryopreserved a CC cryopreservative to the bacterial culture to form a cryopreserved a CC cryopreserved in and storing the cryovial at a temperature below -60 degrees C), CC expressing rhUG (comprising aportion of the cryopreserved solution to a ccyopresial and storing the production seed cell bank culture comprising an expression vector capable of expressing rhUG, inoculating a broth medium with the production seed cell bank culture to form an CC inoculating a large scale fermenter with the inoculaure form and form a fermentation culture, incubating the fermentation culture to form an CC culture within the large scale fermenter, adding an induction agent to the fermentation culture to induce the expression of rhUG and harvesting the above fermentation culture), purifying rhUG, determining the potency cof rhUG, measuring in vitro binding of rhUG and carrier or diluent. The bacterial expression system is useful CC purity of rhUG, and a pharmaceutical composition comprising a purified cryoducing a rhUG is safe to administer to a patient in respiratory diseases. The present sequence is a non-coding strand oligonuclectide construct the synthetic rhUG gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is that of oligonucleotide 6, which was used in the construction of a synthetic gene for the production of human uteroglobin in bacteria. Oligonucleotides 1.4 (see ABZ58370-73) were used to assemble the coding strand and oligonucleotides 5-8 (see ABZ58374-77) the complementary strand. The gene was assembled by annealing and ligation of the oligonucleotides. Because mature native hUG has glutamic acid at its N-terminus, an initiator methionine was added to the N-terminus, and codon usage was optimised for expression in bacteria. In an example from the invention, the synthetic gene was cloned into plasmid poc[2] (see ABZ58378) and recombinant hUG (see ABP72259) was produced in Escherichia coli strain CG12. The invention relates generally to the production of recombinant hUG by bacterial expression, protein purification and scaled-cup productions according to current good manufacturing practices. The recombinant hUG is useful for the treatment of inflammatory and fibrotic conditions, such as neonatal respiratory distress syndrome and scaled-bronchopulmonary dysplasia. It may also be used to treat conditions associated with elevated phospholipase A2 levels such as pancreatitis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0
```

The invention relates to a bacterial expression system for the production

New colon cancer polypeptides and polynucleotides, useful as vaccines

Example 1; SEQ ID NO 6; 64pp; English.

Also included CC are producing an rhUG master cell bank (comprising inoculating a suitable CC incubating both with an aliquot portion of a rhUG research seed bank to CC form a bacterial culture, incubating the bacterial culture, adding a CC cryopreservative to the bacterial culture to form a cryopreserved CC solution, transferring a portion of the cryopreserved cell bank (comprising an expression vector capable of expressing rhUG. inoculating a continue comprising an expression vector capable of expressing rhUG. inoculating a both medium with the production seed cell bank culture coinculating a large scale fermenter with the inoculum formed from the bacterial culture formed in step (b), containing a large scale fermenter, adding an induction agent to culture within the large scale fermenter, adding an induction agent to continue within the large scale fermenter, adding an induction agent to continue formed from the sample, measuring in vitro anti-inflammatory effect arising coff from inhibition or blocking of secretory phospholipase A 2 enzymes by ridig, measuring in vitro anti-inflammatory effect arising the for producing a rhUG research seed bank or a pharmaceutical grade rhUG construct the supersult or a patient in respiratory colisters. The present sequence is a non-ocding strand oligonucleotide cused to construct the synthetic rhUG gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             13-OCT-2003 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ACH35932;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 432 BP; 123 A; 85 C; 103 G; 121 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         hybridisation probes or primers, and in the design and preparation of ribozyme molecules for inhibiting expression of tumour polypeptides and proteins in tumour cells. The compositions are useful for stimulating an immune response against cancer, particularly for the immunotherapy of colon cancer, and as markers for the progression of cancer. ABK4450-ABK46237 represent coding sequences of human colon tumour proteins of the invention. Note: With the exception of SEQ ID No 1 and 2, the sequence data for this patent did not form part of the printed specification but was supplied by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to polynucleotides encoding colon tumour proteins. The polynucleotides and encoded polypeptides are useful in pharmaceutical compositions, such as vaccines, for the diagnosis, prevention, and treatment of colon cancer. Polynucleotide sequences may be used as
                                                                                                                                                                                                                                                                                 (STAC/)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Homo sapiens

The nucleic acid sequences are useful in diagnostics as expressed sequence tags (EST) for identifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA. The purified polypeptide is useful for generating antibodies specific for it. The present sequence is one of the 38043 isolated DNA/EST sequences. Note: The sequence data obtained in electronic format directly from USPTO at segdata.uspto.gov/sequence.html?DocID-20030073623

                                               The present invention provides the protein and coding sequences of a number of human shear stress response proteins. These are useful in t diagnosis, treatment and screening of vascular diseases caused by arteriosclerosis, including heart failure, post-PTCA restenosis and

                                                                                                                                                                                                                                                                                                     The present invention relates to novel differentially regulated genes and polypeptides encoded by them. Sequences of the invention are useful in diagnosing, staging, monitoring, prognosticating, preventing, treating or determining the predisposition to diseases or conditions such as prostate cancer. They may be used as molecular markers, drug targets, vaccines, in gene therapy, research, clinical medicine or forensic science. The present sequence is a differentially regulated prostate cDNA, Pc036-2 which codes for a pre-mRNA splicing factor. Pc036-2 gene is located on the prostate of the prostate of

```
The invention relates to a method of classifying a cell sample as chronic phase chronic myelogenous leukaemia (CP-CML) or blast crisis CML (BC-CML). The method is useful for classifying a sample as CP-CML or BC-CML. The present sequence represents a human chronic myclogenous leukaemia (CML) gene marker used to distinguish blast crisis CML from chronic phase
Cytostatic; antidiabetic; anorectic; gynaecological; antipsoriatic; dermatological; antiarteriosclerotic; antiasthmatic; neuroprotective; nootropic; antiparkinsonian; nephrotropic; human; secreted protein; diagnostic; pharmaceutical; cancer; lung; oesophageal; liver; diabete;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Classifying cell sample as chronic phase chronic myelogenous leukemia or blast crisis chronic myelogenous leukemia by detecting difference in expression of genes corresponding to the markers such as X15415, U89436.
                                                                                                                                                                  Human secreted protein encoding DNA, seq id 141.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 1717 BP; 420 A; 343 C; 465 G; 489 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Disclosure; SEQ ID NO 9; 31pp; English:

The polypeptides and nucleic acid molecules of the invention are useful for preparing a diagnostic or pharmaceutical composition for diagnosing or treating a medical condition. These may be used for diagnosing, preventing or treating disorders related to the human secreted proteins, such as cancer (e.g. lung, cesophageal or liver cancer), diabetes, obesity, metabolic disorders, cardiovascular disorders, reproductive disorders, psoriasis, eczema, bronchitis, cystic fibrosis, atherosclerosis, benign prostatic hyperplasia, asthma, Alzheimer's disease, Parkinson's disease or renal disorders. Sequences given in records for ADP07528.ADP07709 represent human secreted protein encoding

                                                                                                                                                                                                              The invention relates to a novel tumour antigenic peptide or polypeptide comprising a sequence selected from 99 sequences fully defined in the specification. The tumour antigenic peptide or polypeptide comprises a cc sequence selected from 99 sequences fully defined in the specification. Cc where the tumour antigenic peptide preferably has a sequence of Glu-Pro-Cc Pro-Leu-Ser-Glu-Glu-Thr-Phe, and the polypeptide preferably has a cc sequence comprising 393 amino acids fully defined in the specification. Cc The invention further provides a cancer vaccine comprising a tumour cc antigenic peptide or polypeptide, which has cytostatic activity. A tumour cc antigenic peptide, polypeptide, which has cytostatic activity. A tumour cc antigenic peptide, polypeptide, its encoding polymucleotide, a host transformed with the vector containing the cc polymucleotide, a host transformed with the vector or an antibody are compounds that interact with the tumour cantigenic peptide, the polypeptide or its encoding polymucleotide and cr or polymucleotide. The tumour antigenic peptide, the polypeptide or compounds that interact with the polypeptide cor polymucleotide. The tumour antigenic peptide, the polypeptide is useful for inducing cytotoxic T cells. The tumour antigenic peptide is coreal composition useful for treating cancer such as colon, mouth, lung, provides a contibodies. This polymosition useful for treating cancer. The tumour cantigenic peptide is create contibodies. This polymosition useful for treating cancer. The tumour cantigenic peptide is create contibodies. This polymosition useful for treating cancer. The tumour cantigenic peptide is create contibodies. This polymosic polymosition controlled is an antigen to create contribute in the polymosition useful for treating cancer is the bNA encoding one cantibodies.
